**Pesticide Use in Developing Nations: Quick Facts and Resources**

**Overview**

While pesticides pose possible health and environmental hazards wherever they are used, communities in developing nations often face additional hazards uncommon in industrialized nations. The goals of this Toxipedia section are a) to raise public awareness about the impacts of pesticide use in developing nations, and b) to help link environmental health professionals in developing nations with each other and with information resources addressing these complex and critical issues.

**Topic Pages**

- **Suicides from Pesticide Ingestion**
- **Increasing Stocks of Obsolete Pesticides**
- **Export of Toxic Pesticides from Industrialized to Developing Nations**

**General Resources**

**Nonprofit Organizations (NGOs)**

- **Asian NGO Coalition for Agrarian Reform and Rural Development**: "A regional NGO association of 20 national and regional NGO networks from 9 Asian countries actively engaged in food security, agrarian reform, sustainable agriculture, and rural development activities."
- **Environment and Human Rights Advisory**
• **Pesticide Action Network International**: links to international conventions on pesticide use, and sustainable alternatives to chemical pesticides (including crop-specific information)

• **Pesticide Action Network Africa**

• **Pesticide Action Network Asia Pacific**: includes Feb 2010 report *Communities in Peril: Asian Regional Report on Community Monitoring of Highly Hazardous Pesticide Use.*

• **Pesticide Action Network Latin America** (en Español)

• **Pesticide Action Network North America**: excellent compilation of resources pertaining to international pesticide use (international treaties, manufacturer and industry sites, pesticide use statistics, crop loss estimates, international and activist organizations, etc.). Also offers website section Just Transitions to Sustainable Alternatives, which includes the page UN assessment of agriculture, poverty, hunger and the environment.

a) Suicides from Pesticide Ingestion

Quick Facts

"Facts:
• Worldwide, an estimated three million cases of pesticide poisoning occur every year, resulting in an excess of 250,000 deaths.
• This mortality accounts for a substantial fraction of the almost 900,000 people worldwide who die by suicide every year.
• In attempted suicide, which is considerably more frequent than completed suicide, pesticide poisoning results in temporary or permanent disability.
• Intentional and unintentional pesticide poisoning has been acknowledged as a serious problem in many agricultural communities of low- and middle-income countries, including China, India, Sri Lanka, and Viet Nam.
• Efforts to develop a systematic and sustainable approach to the prevention and management of pesticide poisoning remain inadequate."

b) Increasing Stocks of Obsolete Pesticides

Overview

Dangerous and outdated pesticides, most of which have been banned in the US and EU, still pose an immense threat to the health and environment of many developing nations. Many of these pesticides are highly toxic, environmentally persistent chemicals. Developing nations purchase outdated pesticides because they are cheaper. Aid organizations or industrialized nations may offer excess pesticides as donations to developing nations, which lack the means and the funds to dispose of old pesticides. Poor legislative abilities and lack of research also contribute to the problem. Illiteracy and lack of information puts workers at risk, who often fail to protect themselves. These pesticides are also stored in substandard conditions, where they leak, contaminating soil and water. (sources: FAO, PAN-UK, Regulatory Toxicology and Pharmacology, Africa Recovery)

"Most developing countries are left with large stocks of obsolete pesticides. Generally, these are excess pesticides that can no longer be used because they have deteriorated as a result of prolonged storage, or because their use has been banned while they were still kept in store. They are now regarded as hazardous waste. Due to lack of environmentally sound disposal facilities in developing countries, the total volume of such stocks is gradually increasing. Most of the stocks are kept in sub-standard stores and are in a deplorable state. Drums are stored in the open, exposed to direct sunlight and rain. As time goes by, containers deteriorate and start leaking. This process is
often accelerated by unfavourable climatic conditions. These obsolete stocks invariably pose a severe threat to human health and the environment, particularly if they are located in urban areas or near water bodies, which unfortunately is often the case. Ground water, irrigation water and drinking water are at risk. Direct exposure of human beings, livestock or food is another danger. Disasters caused by obsolete pesticides can be expected if adequate action is not taken to address the present situation.”

c) Export of Toxic Pesticides from Industrialized to Developing Nations

Quick Facts

Banned Pesticides Being Sold in Developing Countries

"There are many cases where highly hazardous pesticides, which are not permitted for use in industrialized countries, are exported to developing countries.

For a pesticide to be banned, it has to be registered first. Some pesticide companies have not registered or re-registered products which they knew would have not have been authorized in their own country but continue to produce and export the same products to developing countries. There are also cases of pesticide manufacturers
increasing exports of products that have been banned or restricted in their own countries, possibly in order to use up existing stocks or to compensate for depleted local markets.

Pesticide companies have also been able to circumvent bans on specific products by building formulation plants for the product in developing countries. They then supply the technical grade active ingredients needed to make the pesticide and claim that the product itself is locally manufactured.

The argument is put forward that developing countries are demanding these hazardous pesticides because less toxic products are often too expensive."

U.S. Exported 27 Million Pounds (12.3 Million Kilograms) of Pesticides Banned in U.S. between 2001 and 2003

"According to U.S. Customs records, between 2001-2003, the U.S. exported nearly 1.7 billion pounds of pesticide products - 32 tons per hour. A study by Carl Smith of the Foundation for Advancement in Science and Education, published in the International Journal of Occupational and Environmental Health, notes that these exports included "27 million pounds of pesticides whose use is forbidden in the U.S.," including "500,000 pounds of known or suspected carcinogens." Endocrine disrupting pesticides were sent overseas at the rate of 100 tons a day. Most of the exports - including shipments of deadly persistent organic pollutants (POPs) - were destined for developing countries."

U.S. Environmental Protection Agency Policy on Export of Unregistered Pesticides

"Pesticides that are not approved - or registered - for use in the U.S. may be manufactured in the U.S. and exported. FIFRA Section 17(a) requires that exporters of unregistered pesticides first obtain a statement signed by the foreign purchaser indicating the purchaser's awareness of that product in the U.S. The requirement is shipment-specific for a particular exporter, product and purchaser.

To ensure that national officials responsible for the protection of health and the environment are informed of this shipment, EPA transmits a copy of the statement to the Designated National Authority (DNA) (so designated as part of the United Nations program on Prior Informed Consent) in the receiving country. EPA is placing the highest priority on timely notification for two categories of exported pesticides which EPA believes may be of greatest concern to countries:

1. pesticides on the international list of Prior Informed Consent (PIC), most of which have also been banned or severely restricted in the U.S., and
2. other pesticides banned and severely restricted in the U.S. for health or environmental reasons, which are not on the PIC list.

It is EPA's intention to make the U.S. export notification program compatible with the international one, while meeting domestic legislative requirements. Revisions to the U.S. export notification program will be considered in the context of implementation of the PIC Agreement."
